Radiation therapy or radiotherapy, often abbreviated RT, RTx, or XRT, is a therapy using ionizing radiation, generally as part of cancer treatment to control or kill malignant cells and normally delivered by a linear accelerator. Radiation therapy may be curative in a number of types of cancer if they are localized to one area of the body. It may also be used as part of adjuvant therapy, to ...

Radiation therapy - Wikipedia

Radiotherapy is a type of ionising radiation (high energy) that destroys the cancer cells in the treated area by damaging the DNA of these cells. Radiation also affects normal cells. This can cause side effects in the treatment area. Usually the side effects improve a few weeks after treatment, but some might continue long term.

What is radiotherapy? | Cancer treatment | Cancer Research UK

Radiation injury, tissue damage or changes caused by exposure to ionizing radiation—namely, gamma rays, X-rays, and such high-energy particles as neutrons, electrons, and positrons. Sources of ionizing radiation may be natural (e.g., radioactive substances such as the element radium or the radioisotopes potassium-40 and carbon-14) or man-made (X-ray machines, nuclear reactors, particle accelerators, nuclear weapons, etc.).

Radiation injury | pathology | Britannica

Radiation therapy uses high-energy rays (such as x-rays) or particles (such as photons, electrons, or protons) to kill cancer cells. When is radiation therapy used? If a tumor is very large or is on an area of the skin that makes it hard to remove with surgery, radiation therapy may be used as the main treatment.
