Lab 8: Simple Harmonic Motion Objectives Experimentally find the angular frequency of a simple harmonic oscillator and compare this with the theoretical value. Use the Fast Fourier Transform (FFT) function to find the peak frequency. Experimentally test the relationship between the mass of the object and the angular frequency of the oscillator.

Lab 8: Simple Harmonic Motion Amanda Beerer Performed April 19, 2020 PHY 111 C41. Objective: The purpose or objective of this lab was to observe simple harmonic motion and to relate amplitude period and frequency. In the first experiment we used an oscillating spring with varying masses and amplitudes to observe the principle of simple harmonic motion, and in the second part of the experiment we used a pendulum.

Physics 111 Lab #8: Simple Harmonic Motion A force probe and motion detector, in conjunction with an oscillating hanging mass on a spring, will be used to study simple harmonic motion (Lectures 24, 25).

Physics 111: Lab #8

Introduction: Simple harmonic motion is a type of motion where the restoring force on the moving object is directly proportional to the object's displacement magnitude and acts towards the object's equilibrium position. This results in an oscillation which, in a perfect condition, would continue indefinitely. In this lab, I will be finding the angular frequency of the iOLab device as it is ...

simple harmonic oscillator mathematically. In general, any motion that repeats itself at regular intervals is called periodic or harmonic motion. Examples of periodic motion can be found almost anywhere; boats bobbing on the ocean, grandfather clocks, and vibrating violin strings to name just a few. Simple Harmonic Motion (SHM) satisfies the

Simple Harmonic Motion. Simple harmonic motion (SHM) is the motion of an object subject to a force that is proportional to the object's displacement. One example of SHM is the motion of a mass attached to a spring. In this case, the relationship between the spring force and the displacement is given by Hooke's Law, $F = -kx$, where k is the spring constant, x is the displacement from the equilibrium length of the spring, and the minus sign indicates that the force opposes the displacement.

then the motion of the pendulum will be simple harmonic motion and its period can be calculated using the equation for the period of simple harmonic motion $T = 2\pi \sqrt{\frac{m}{k}}$. (2) It can be shown that if the amplitude of the motion is kept small, Equation (2) will be satisfied and the motion of a simple pendulum will be simple harmonic motion, and

The Simple Pendulum
Simple harmonic motion is characterized by this changing acceleration that always is directed toward the equilibrium position and is proportional to the displacement from the equilibrium position. Furthermore, the interval of time for each complete vibration is constant and does not depend on the size of the maximum displacement. In some form, therefore, simple harmonic motion is at the heart of timekeeping.

Harmonic motion Most of what you need to know about harmonic motion has been covered in the lectures, so we won't repeat it in depth here. The basic idea is that simple harmonic motion follows an equation for sinusoidal oscillations: $x_{undamped} = A \cos(\omega t + \phi)$ We have added here a phase ϕ , which simply allows us to choose any arbitrary time as $t = 0$.
