To being, one must take a look at the evaluation of three primary loads that act on the aircraft wing: aerodynamic lift, load due to wing structure weight, and load due to the weight of the fuel contained in the wing. These loads act

perpendicular to the wing surface, and their magnitude varies along the length of the wing (Figures 1a, 1b, and 1c).

### **Analytical modeling of aircraft wing loads - Aerospace ...**

Each particular aircraft type has its own flight envelope, expressed in terms of the “V-n” diagram. V = Indicated Equivalent Airspeed. n = Limit Load Factor. The load factor is basically the ratio of the lift to the weight of the aircraft =  $L/W$  and it is expressed as a factor of acceleration due to gravity ‘g’.

### **Aircraft Ultimate Loads | Stress Ebook LLC.**

The ratio between lift and aircraft weight is called the load factor n, where , i.e.  $n = 0$  for free fall,  $n = 1$  for level flight,  $n >$

1 to pull out of a dive and  $n < 1$  to pull out of a climb. The overall load spectrum of an aircraft is captured graphically by so called velocity – load factor (V-n) curves.

A load factor of one, or 1 g, represents conditions in straight and level flight, where the lift is equal to the weight. Load factors greater or less than one (or even negative) are the result of maneuvers or wind gusts.

### **Load factor (aeronautics) - Wikipedia**

Critical load cases are selected and tested on the full scale structures for the full load held for 3 seconds in each load case. In addition to the full scale unit tests, detail tests for the 1.33 fitting factor may also be conducted on components such as dual bolt restraint devices, quarter turns or seat track fittings.

## **Aircraft Cabin Interiors Structures Certification**

Aircrafts are subject to a wide range of static and dynamic loads occurring either in flight, e.g. from manoeuvres and the effects of turbulence, and also on the ground, e.g. landing, take-off, taking, and braking. With aircraft calculation of the loads is an extremely important part of the design process.

### **Aircraft loads: what are they and why are they important?**

Structural loads or actions are forces, deformations, or accelerations applied to structure components. Loads cause stresses, deformations, and displacements in structures. Assessment of their effects is carried out by the methods of structural analysis. Excess

load or overloading may cause structural failure, and hence such possibility should be either considered in the design or strictly controlled. Mechanical structures, such as aircraft, satellites, rockets, space stations, ships, and submar
