Lorentz Transformations of Special Relativity. If two Lorentz frames x and x' have the same coordinates at $(x, y, z, t) = (0, 0, 0, 0)$, and if the x' -frame is moving in the x -direction with a speed of v , then the x' -coordinates of an event are given by. $x' = x - vt$ $1 - v^2/c^2$. ; $y' = y$; $z' = z$; $t' = t - vx/c^2$.

The mathematics of general relativity are complex. In Newton's theories of motion, an object's length and the rate at which time passes remain constant while the object accelerates, meaning that many problems in Newtonian mechanics may be solved by algebra alone. In relativity, however, an object's length and the rate at which time passes both change appreciably as the object's speed approaches the speed of light, meaning that more variables and more complicated mathematics are required to calculate
