Validation and calibration of numerical models is vitally important, particularly in the field of cave mining where our ability to monitor the caving rock mass is limited. As part of a project investigating caving mechanics, physical models of caving were tested in a geotechnical centrifuge (Cumming-Potvin et al. 2016b). This paper describes numerical simulations of one of the centrifuge tests.

This paper discusses methods for realistic simulation of slope failure owing to heavy precipitation in a

centrifuge. A rain simulator was developed to provide precipitation that satisfies the conditions in a centrifuge so that the impact pressure on the ground surface in the centrifuge (ρm) was reduced to the same level in the prototype (ρp). Pneumatic spray nozzles, producing fine droplets with a mean diameter of 20 μm , yield large precipitation intensity of 1500 mm/h on the model at 50 g.

Abstract. Model tests

were performed at the Geotechnical Centrifuge Facility of Delft University of Technology, The Netherlands, to examine the mechanics of light non-aqueous-phase liquid (LNAPL) movement in a partially saturated porous granular medium. Centrifuge model tests are an effective way to study the deformation and failure mechanism of the slopes, as gravity stress is simulated equivalent to the prototype in the small-scale model. Therefore, centrifuge model tests were

conducted to simulate the slope failure under various loading conditions (Likitlersuang et al., 2017 , Wang and Zhang, 2013).

A numerical model of a centrifuge experiment on tunnel located in sand is being presented. The experiment was carried out under seismic loading using a dynamic actuator. The responses of the tunnel and of the sand were measured. The numerical model is based on a hypoplastic constitutive model with intergranular strains implemented in the FE-code TOCHNOG.

With the knowledge of centrifuge test results provided in the Type-C simulation phase, only the contraction parameter c_1 (controlling the pore pressure generation) was adjusted to better capture the dynamic response of the selected centrifuge tests, leading to what is presented herein as the modified Type-B simulations. The adjustment of this parameter is based on observations for all selected centrifuge test results provided in the Type-C simulation phase.

The simulations are performed in the centrifuge model scale by using a strain space multiple mechanism model; the radial gravity field is applied

to the model ground at the stage of self-weight analyses before seismic response analyses are carried out.
