Affinity chromatography is a very useful technique for "polishing", or completing the protein purification process. Beads in the chromatography column are cross-linked to ligands that bind specifically to the target protein. The protein is then removed from the column by rinsing with a solution containing free ligands.

Methods for Protein Purification in Biotechnology

The four methods of protein purification are: (1) Extraction (2) Precipitation and Differential Solubilisation (3) Ultracentrifugation and (4) Chromatographic Methods. The methods used in protein purification, can roughly be divided into analytical and preparative methods. The distinction is not exact, but the deciding factor is the amount of protein, that can practically be purified with that method.
