Calf Fluid Therapy Made Simple

It is possible to provide appropriate and cost-effective fluid therapy to calves. If fluid deficits are corrected fully and aggressively, and combined with other appropriate therapy, morbidity and mortality can be reduced. The simpler the fluid therapy plan, the less likely iatrogenic derangements will occur, particularly if acid-base status and electrolyte

concentrations cannot be measured frequently or at all.

As mentioned previously, IV therapy is indicated in calves that are 8 percent or more dehydrated or are showing signs of CNS depression or weakness, are comatose or absent suckle, and/or calves that have rapidly progressive diarrhea or

fail to respond to oral therapy. Goals of IV fluid therapy include: restoring the calf to normovolemia, correcting metabolic acidosis, correcting mental depression, restoring suckle reflex, correcting electrolyte abnormalities and correcting energy deficit.

Treating calf scours | Bovinevetonline

Any calf with a very weak or absent suckle reflex should be given IV fluid therapy because, if oral fluids are given to a calf with ileus (no gut motility), the fluid is not absorbed but instead pools in the rumen resulting in bloat and/or rumen acidosis. ANY calf that is severely depressed and unable to stand requires intravenous

fluids. 4.
