A conic section is a curve on a plane that is defined by a 2nd degree polynomial equation in two variables. Conic sections are classified into four groups: parabolas, circles, ellipses, and hyperbolas. Conic sections received their name because they can each be represented by a cross section of a plane cutting through a cone.

Conic Section. The conic sections are the nondegenerate curves generated by the intersections of a plane with one or two nappes of a cone. For a plane perpendicular to the axis of the cone, a circle is produced. For a plane that is not perpendicular to the axis and that intersects only a single nappe, the curve produced is either an ellipse or a parabola (Hilbert and Cohn-Vossen 1999, p. 8).

Eccentricity. That ratio above is called the " eccentricity ", so we can say that any conic section is: "all points whose distance to the focus is equal. to the eccentricity times the distance to the directrix ". For: $0 < \text{eccentricity} < 1$ we get an ellipse, $\text{eccentricity} = 1$ a parabola, and. $\text{eccentricity} > 1$ a hyperbola.

When I first learned conic sections, I was like, oh, I know what a circle is. I know what a parabola is. And I even know a little bit about ellipses and hyperbolas. Why on earth are they called conic sections? So to put things simply because they're the intersection of a plane and a cone. And I draw you that in a second.
