### Damping of materials and members in structural mechanics ...

Abstract. The state of a structure subject to oscillatory deformation can be described by the combination of kinetic and potential energy. In the case of real structures there is also an energy dissipative element as some of the energy is lost per deformation cycle. The energy dissipation is caused by material damping which basically depends on three factors: amplitude of stress, number of cycles and geometry.

### Damping of materials and members in structures - IOPscience

The step from material properties to members with damping properties is outlined. Damping in assemblies such as laminated members, damping in structural joints, damping due to fluids and damping by squeezing are prescribed. Models for damped structures are provided by the Finite Element Method and the Boundary Element Method.

Concrete Damping Under steady state conditions, internal damping in prestressed concrete members may be less than 1% of critical if the initial prestress is sufficient to prevent tension cracks from developing. If tension cracks are allowed to develop, but on a microscopic scale, damping can be expected of the order of 2% of critical.

A damping coefficient is a material property that indicates whether a material will bounce back or return energy to a system. For example, a basketball has a low damping coefficient (a good bounce back). If the bounce is caused by an unwanted vibration or shock, a high damping coefficient in the material will diminish the response.
