Bone, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the support structure of the body. In the areas of the skeleton where bones move (for example, the ribcage and joints), cartilage, a semi-

rigid form of connective tissue, provides flexibility and smooth surfaces for movement.

6.1 The Functions of the Skeletal System - Anatomy and ...

The physiology of the skeletal system also allows the body to move around with different ranges of movement. This is because bones have joints at both ends that connect the bones to each other, but still let them twist and turn in different directions. The skeletal system is often assisted by the muscular system and controlled by the nervous system.
