$pR^n$  has the form  $(p;v)$  where  $p$  is the point of attachment or base-point and  $v$  is the vector part of  $(p;v)$ . The set  $T. pR^n$  is naturally a vector space by:  $(p;v) + (p;w) = (p;v+ w)$  &  $c(p;v) = (p;cv)$ : Moreover, the dot-product and norm are defined by the usual formulas on the vector part:  $(p;v) \cdot (p;w) = v \cdot w$ .

In the past decade there has been a significant change in the freshman/ sophomore mathematics curriculum as taught at many, if not most, of our colleges. The geometrical study of a surface  $M$  in Euclidean space  $R^3$  separates into three distinct categories: the intrinsic geometry of  $M$ , the shape of  $M$  in  $R^3$ , and the Euclidean geometry of  $R^3$ . Geometry of  $R^3$  is based on the dot product and consists of those concepts preserved by the isometries of  $R^3$ . The chapter emphasizes that the geometry of  $M$  is also based on the dot product—applied only to vectors tangent to  $M$ —and that it consists of those features preserved by the isometries of  $M$ .
