After you make sure you found all solutions with optimal solution origRes, then we can go and find solution which is not optimal as origRes. I did it on a way to add condition that new solution needs to be $\leq (\text{origRes} - 0.01)$ because I know that all solutions will be with 2 decimal places. Go to step 2 again

Generating multiple optimal solutions using Excel solver
The output states that the solution remains optimal as long as the objective function coefficient of x_1 is between 0 and 12. Since 4 is within this range, the optimal solution will not change. However, the optimal total cost will be affected: $6x_1 + 9x_2 = 4(1.5) + 9(2.0) = \24.00 . 23 Example 3
