The high frequency range is approximately 800-2000 Hz. Using a 24 VDC input voltage to the circuit, the voltage output, measured using a spark gap and spherical electrodes is approximately 10-14 KV. By changing capacitors C1 and C4, one can vary the operating frequency and output voltage of the circuit, see chart below.

There are several possibilities for generating the high control voltage, including a PLL frequency synthesizer with an integrated charge pump. A phase-locked loop (PLL) is a feedback system that combines a voltage-controlled oscillator (VCO) and a phase detector in such a way that the oscillator signal tracks an applied frequency or phase-modulated signal with the correct frequency and phase.
