Propylene Production Via Propane Dehydrogenation

Oxidative dehydrogenation of propane is of particular importance with propane being a main component of natural gas. This makes propane a preferable raw material, to be a substitute of naphtha in the manufacturing of propylene.

Propylene production via propane oxidative dehydrogenation ...

In this scenario, routes to obtain propylene from lighter feedstock, instead of from crude oil, are becoming more and more interesting. Thus the propane dehydrogenation (PDH) reaction is a promising alternative to meet the rising global propylene demand (see Making Propylene On-Purpose; this issue).

Propylene production via propane dehydrogenation (PDH)

The increasing demand for propylene and the availability of low-cost feedstock make propane dehydrogenation an economically attractive chemical route. Propane, the main feedstock for propane dehydrogenation (PDH) processes, can be obtained as a byproduct of petroleum refinery operations and can be recovered from propane-rich liquefied petroleum gas (LPG) streams from natural-gas processing plants.

Technology Profile: Propylene Production via Propane ...

Over the last decade, much effort has been dedicated to obtaining efficient catalysts for propylene production via catalytic dehydrogenation of propane. But little attention has been paid to Nb-containing multicomponent mixed oxides, which showed excellent performance in oxidative dehydrogenation (ODH) of alkanes , , , .

ZnNbO catalysts for propylene production via catalytic ...

A novel process scheme for propylene production via propane dehydrogenation has been investigated. The solution foresees the integration of the reaction unit with a Pd based membrane for the recovery of hydrogen, enabling accordingly the shift of chemical equilibrium and the attainment of a sustainable propane conversion even at lower temperature than conventional one.

Steam-activated FeZSM-5 (Si/Al = 31.3 and 0.67 wt % Fe) is a highly efficient catalyst for the N₂O-mediated oxidative dehydrogenation of propane (ODHP), with propene yields up to 25% at 723 K, but strongly deactivates due to coke formation.

Because the initial ODHP performance was recovered upon air-regeneration of the spent catalyst, a process for continuous propylene production via alternation of reaction and regeneration cycles has been evaluated.

Cyclic Process for Propylene Production via Oxidative ...

The two main sources of propylene are as a byproduct from the steam cracking of liquid feedstocks such as naphtha as well as LPGs, and from off-gases produced in fluid catalytic cracking (FCC) units in refineries. The remainder of propylene is produced using on-purpose technologies such as propane dehydrogenation (PDH) and metathesis.

Direct propane dehydrogenation (PDH) is an attractive technology for propylene production. We show here that propane conversion is significantly enhanced by the addition of ZnO to Cr 2 O 3. Furthermore, its activity is strongly dependent on the Zn/Cr molar ratio and one with Zn/Cr = 0.3 gives the highest propane conversion and propylene selectivity among the studied Zn x Cr catalysts (x denoting the molar
