Cohesive Zone Model (CZM) | Scientific.Net

The Cohesive Zone Model does not represent any physical material, but describes the cohesive forces which occur when material elements are being pulled apart. As the surfaces separate, traction first increases until a maximum is reached, and then subsequently reduces to zero which results in complete separation. The variation in traction in relation to displacement is plotted on a curve and is called the traction-displacement curve. The area under this curve is equal to the energy needed for sep

(CZM) approach (Dugdale, 1960; Barenblatt, 1962; Hillerborg et al., 1976) is a common tool for the simulation of quasi-brittle fracture. Cohesive zone models represent a damage zone that develops near the tip of a crack assuming that all inelastic material response can be lumped to a surface ahead of the crack tip.

In the CZM, fracture is regarded as a gradual phenomenon. When material elements are pulled apart, separation will take place across a cohesive zone, and the pulling effect will be resisted by cohesive tractions. Here, the cohesive zone elements do not represent any physical materials but the cohesive forces.
