Control Flow Graph based Framework for effective ...

A control-flow graph (cfg) models the flow of control between the basic blocks in a program. A cfg is a directed graph, $G = (N, E)$. Each node $n \in N$ corresponds to a basic block. Each edge $e = (n_i, n_j) \in E$ corresponds to a possible transfer of control from block n_i to block n_j .

Data-flow analysis is a technique for gathering information about the possible set of values calculated at various points in a computer program. A program's control flow graph (CFG) is used to determine those parts of a program to which a particular value assigned to a variable might propagate. The information gathered is often used by compilers when optimizing a program.

optimizations in classic imperative style, we built a control-flow graph using mutable pointers and other mutable state in the nodes. This decision proved unfortunate:

the mutable flow graph was big and complex, and it led to many bugs. We have replaced it by a smaller, simpler, applicative flow graph based on Huet's (1997) zipper.

Data Flow Tracker . The workhorse of the CPG is a state-of-the-art data-flow tracker. The data-flow tracker is interprocedural, flow-sensitive, context-sensitive, field-sensitive, and operates on an intermediate code representation (see semantic code property graphs). The engine performs on-
