Uip Tcp Ip Protocol Stack

The uIP is an open-source implementation of the TCP/IP network protocol stack intended for use with tiny 8- and 16-bit microcontrollers. It was initially developed by Adam Dunkels of the "Networked Embedded Systems" group at the Swedish Institute of Computer Science, licensed under a BSD style license, and further developed by a wide group of developers. uIP can be very useful in embedded systems because it requires very small amounts of code and RAM. It has been ported to several platforms, inc

The uIP TCP/IP stack is intended to make it possible to communicate using the TCP/IP protocol suite even on small 8-bit micro-controllers. Despite being small and simple, uIP do not require their peers to have complex, full-size stacks, but can communicate with peers running a similarly light-weight stack.

Contiki 2.6: The uIP TCP/IP stack

The TCP/IP Protocol Stack. TCP/IP is the world's most widely-used non-proprietary protocol suite because it enables computers using diverse hardware and software platforms, on different types of networks, to communicate. The protocols work equally well in both LANs and WANs. TCP/IP is a collection of protocols named after its two best-known and most important protocols, the Transmission Control Protocol (TCP) and the Internet Protocol (IP).

The TCP/IP Protocol Stack

As seen in the figure above, the Internet protocol stack provides a connection oriented reliable

branch (TCP) and an connectionless unreliable branch (UDP) both build on top of the Internet Protocol. The Internet Protocol layer in the TCP/IP protocol stack is the first layer that introduces the virtual network abstraction that is the basic principle of the Internet model. All physical implementation details (ideally even though this is not quite true) are hidden below the IP layer.
