Brick Bonding | SpringerLink

Bonding is the arrangement of bricks in a structure such as a wall or column . Very broadly, bricks can be laid as soldiers (standing upright), stretchers (laid lengthwise along the wall) or headers (laid width wise along the wall). Bricks are typically laid to an offset pattern to maintain an adequate lap between joints from one course to the next and to ensure that vertical joints are not positioned above one another on consecutive courses.

The bonding of brickwork is the arrangement of brickwork by the

pattern of headers (the shorter face of the brick) and stretchers (the longer face of the brick). The most common form of bond on historic buildings is Flemish Bond. Modern cavity walls are built in the monotonous Stretcher Bond.

Brick Bonds - The Heritage Directory

Structural bonding of solid and reinforced brick masonry walls is sometimes accomplished by grout which is poured into the cavity or collar joint between wythes of masonry. The method of bonding will depend on the use requirements, wall type and other factors, However, the metal tie method is generally recommended for exterior walls.

Bonds and Patterns in Brickwork

The overlap, which is usually of half brick, is obtained by commencing each alternate course with a half brick bat. Stretching bond is used for half brick wall only. This bond is also termed as running bond and is commonly adopted in the construction of half brick thick leaves of cavity walls, partition walls, etc. Since there are no headers, suitable reinforcement should be used for structural bond.

Types of Brick Bonds | The Construction Civil

The general dimension of the brick is considered as 9" x 4 ½" and 3" (length x width x thickness). If the brick is laid in a

course in a way that its length is parallel to that of the wall the brick position is said as a stretcher. But if 4 ½" x 3" is shown on the face of the wall this position is termed as header.
