Binomial Lattice Model For Stock

Binomial lattice model for stock prices Here we model the price of a stock in discrete time by a Markov chain of the recursive form $S_{n+1} = S_n Y_{n+1}$, $n \geq 0$, where the $\{Y_i\}$ are iid with distribution $P(Y = u) = p$, $P(Y = d) = 1 - p$. Here $0 < d < 1 + r < u$ are constants with r the risk-free interest rate $((1 + r)^x$ is the

In finance, the binomial options pricing model (BOPM) provides a generalizable numerical method for the valuation of options. Essentially, the model uses a "discrete-time" (lattice based) model of the varying price over time of the underlying financial instrument, addressing cases where the closed-form Black-Scholes formula is wanting. The binomial model was first proposed by William Sharpe in the 1978 edition of Investments (ISBN 013504605X), and formalized by Cox, Ross and Rubinstein in ...
