T2 relaxation is a complex phenomenon, but at its most fundamental level, it corresponds to a decoherence of the transverse nuclear spin magnetization. Random fluctuations of the local magnetic field lead to random variations in the instantaneous NMR precession frequency of different spins.

These fractions of water are

For when labile protons must be observed, there is a "flip-back" version that preserves

their signal, even when they are exchanging with the suppressed water signal. PURGE (Pre-saturation Utilizing Relaxation Gradients and Echoes) is another (pre-saturation) solvent suppression technique.

Water Proton NMR: A Tool for Protein Aggregation ...

The presence or absence of H_2O coordinated to a paramagnetic center can in principle be monitored by solvent water ^1H NMR, 69 by exploiting the occurrence of a magnetic interaction between the magnetic moments of the unpaired electrons and the nuclear magnetic moments of the water protons. When this interaction fluctuates with time, it causes a shortening of the water-proton relaxation times.*

$^{20}\text{O@C } 60$ displays a remarkable proton NMR spectrum, with six well resolved peaks. These peaks are due to the J-coupling between the water protons and the ^{17}O nucleus, which has spin-5/2. The resolution of these peaks is enabled by the suppression of water proton exchange by the fullerene cage.
