Abstract. Mitochondria are critical for respiration in all tissues; however, in liver, these organelles also accommodate high-capacity anaplerotic/cataplerotic pathways that are essential to gluconeogenesis and other biosynthetic activities. During nonalcoholic fatty liver disease (NAFLD), mitochondria also produce ROS that damage hepatocytes, trigger inflammation, and contribute to insulin resistance.

Abstract . Oxidative stress and hepatic mitochondria play a role in the pathogenesis of nonalcoholic fatty liver disease. The aim of the present study was to evaluate the role of hepatic mitochondrial dysfunction and oxidative stress in the pathogenesis of the disease.

These roles assign mitochondria a gateway function in protecting hepatocyte from injury since unbalanced mitochondrial function

unequivocally affects cell survival by actively causing the onset and perpetuation of liver diseases. Abnormal mitochondrial function is reported to be involved in a variety of liver diseases including drug-induced liver injury, alcoholic liver disease, non-alcoholic fatty liver disease, viral hepatitis, primary and secondary cholestasis, hemochromatosis, and Wilson ...

Conclusion: As mitochondria are a major source of ROS, the present review summarizes the role of mitochondrial oxidative stress in ASH and NASH and presents emerging data indicating the need to preserve mitochondrial antioxidant balance as a potential approach for the treatment of human fatty liver disease, which may pave the way for the design of future trials to test the therapeutic role of antioxidants in fatty liver disease.

Mitochondrial respiratory chain is the main subcellular source of reactive oxygen species (ROS), which may damage mitochondrial proteins, lipids and mitochondrial DNA. Cardiolipin, a phospholipid located at the level of the inner mitochondrial membrane, plays an important role in several reactions and processes involved in mitochondrial bioenergetics as well as in mitochondrial dependent steps of apoptosis.

OXIDATIVE STRESS AND ALCOHOLIC LIVER DISEASE

Excess amounts of oxidant agents may be released in liver mitochondria in various cases of liver diseases, including ALD. Clinical research has revealed that mitochondria that are chronically exposed to ethanol display increased production of ROS and

undergo several irreversible changes.

Oxidative stress as a crucial factor in liver diseases

One suggested mechanism involves the oxidation of biomolecules by mitochondrial ROS which initiates a vicious cycle of exacerbated mitochondrial dysfunction and increased hepatocellular oxidative damage. This may ultimately pave the way for hepatic inflammation and liver failure.

Abstract. Aging induces liver morphological, structural, and functional changes that are consistent with

increased levels of reactive oxygen species and oxidative damage. Aging not only increases oxidative-induced mitochondrial damage but also induces mitochondrial dysfunction in the liver. Therefore increased damage to the mitochondria may set the aged liver at increased risk of liver disease and poor prognosis.

Oxidative stress as a crucial factor in liver diseases

Mitochondria are the main energy source in hepatocytes and play a major role in extensive

oxidative metabolism and normal function of the liver. This key role also assigns mitochondria a gateway function in the center of signaling pathways that mediate hepatocyte injury, because impaired mitochondrial functions affect cell survival and contribute to the onset and perpetuation of liver diseases.
