Cinnamic Acid Knoevenagel Condensation Mechanism

The Knoevenagel condensation reaction is an organic reaction named after Emil Knoevenagel. It is a modification of the aldol condensation. A Knoevenagel condensation is a nucleophilic addition of an active hydrogen compound to a carbonyl group followed by a dehydration reaction in which a molecule of water is eliminated. The product is often an α,β -unsaturated ketone. In this reaction the carbonyl group is an aldehyde or a ketone. The catalyst is usually a weakly basic amine. The active ...

Knoevenagel condensation -

Wikipedia

The Knoevenagel reaction in its simplest form is the condensation of malonic esters (or their analogues) with aldehydes or ketones in the presence of an amine base catalyst plus a small amount of carboxylic acid (or amino acid) cocatalyst. The condensation products are often α,β -unsaturated carbonyl compounds. For example,

Abstract With this procedure malonic acid itself, rather than its diester, can be effectively condensed with benzaldehyde to produce trans-cinnamic acid.

The Knoevenagel condensation was typically carried out as follows: To a solution of a carbonyl compound (1, 1.27 mmol) and an active methylene compound (2, 1.3 mmol) in toluene (1.1 mL), solid catalyst (100 mg) was added and stirred at 30 °C for 0.1–3 h. The reaction was monitored by thin-layer chromatography (TLC) on silica (eluent: ethyl acetate-hexane).

Knoevenagel Condensation - an overview | ScienceDirect Topics

The Knoevenagel condensation is an organic reaction used to convert an aldehyde or ketone and an

activated methylene to a substituted olefin using an amine base as a catalyst. The reaction begins by deprotonation of the activated methylene by the base to give a resonance stabilized enolate. The amine catalyst also reacts with the aldehyde or ketone to form an iminium ion intermediate, which then gets attacked by the enolate.

compounds condense with aldehydes and ketones to give substituted alkenes. Piperidine is generally used as the catalyst. Nitromethane also undergoes similar reaction to give nitroolefins.

Knoevenagel Condensation | Chem-Station Int. Ed.

Mechanism: The best pathway involves condensation of aniline with aldehyde to form a Schiff's base, which is then attacked by the enol form of pyruvic acid to yield an intermediate, which undergoes intramolecular cyclization yielding a product that is oxidized to a quinoline derivative.

Doebner

Modification - an overview | ScienceDirect Topics

The Knoevenagel condensation reaction of acetylacetone with benzaldehyde catalyzed by piperidine in methanol solvent takes place via carbinolamine, iminium, and enolate intermediates. The step of iminium ion formation is the rate-determining one and involves elimination of a hydroxide ion from the carbinolamine intermediate.

Mechanism of the Piperidine-Catalyzed Knoevenagel ...

Abstract. The mechanism of the Doebner modification of the Knoevenagel reaction has been assumed by many authors (see thesis) to proceed through an

isolable intermediate, a benzalmalonic (or ethylidene malonic) acid, although there has not been any proof for this mechanism reported in the literature. The purpose of this work is an investigation of the mechanism of the Doebner modification.

The Knoevenagel reaction is a variant of

the aldol condensation historically performed with malonic acid (or malonate ethyl), although it can theoretically be performed with any 1 - 3 dicarbonyl compound (β - dicarbonyl). To generate the enolate of malonic acid pyridine or piperidine are usually used.
