The whole process around plastic injection moulding begins with taking the raw plastic material in the form of granules or tiny pellets. This is then fed through a hopper and melted at high heat. When the plastic is soft enough, it

is then injected under pressure into a single or multi-cavity mould to produce the desired shape or shapes.

Injection molding is mainly used to enhance the molding of PET. PET can only be molded by a screw type injection molding machine in general. It is best to choose a mutant screw with a reverse ring at the top, which has a large surface hardness and wear resistance, and the ratio of the length to diameter ratio not $L/D = (15 \sim 20):1$ compression is about 3:1.

Do you know the whole process of PET injection molding?

Successful processing of LifeSciences TPU compounds by injection molding is very dependent upon a wide range of variables such as machine size, shot size, screw geometry and mold design. Due to these factors, exact machine conditions for optimum processing have to be determined by the processor for the system chosen.

Injection Molding Guide - Lubrizol

Liquid silicone injection is a process very similar to injection molding but differs in that the mold is heated to a high temperature. Normally, lead time is longer than injection molding, and the part can be as detailed as injection molded parts, which means either no flash or a very thin flash.
