### Oxidation Reduction And Electrochemistry Section

Oxidation-Reduction Reactions In an oxidation-reduction (Redox) reaction, electrons are transferred from one species to another. For example, in a single replacement reaction  $\text{Cu (s)} + 2 \text{AgNO}_3 \text{ (aq)} \rightarrow \text{Cu(NO}_3)_2 \text{ (aq)} + 2 \text{Ag (s)}$  The Cu atoms lose electrons to form  $\text{Cu}^{2+}$  in the  $\text{Cu(NO}_3)_2 \text{ (aq)}$

But LEO the lion says GER. And this is to remember that losing an electron means you are being oxidized, or losing electrons is oxidation. And gaining electrons is reduction. So that's just a mnemonic. Another one that's often used is OIL RIG. And this, essentially-- oxidation is losing electrons, reduction is gaining electrons.

Oxidation Reduction Oxidation states Also called redox reactions, they are reactions where one species loses electrons, and another species gains electrons. (Section 18.1) The loss of electrons. Oxidation is loss (OIL). Also defined as an increase in oxidation state. (Section 18.1) The gain of electrons. Reduction is Gain (RIG). Also defined as a decrease in oxidation state. (Section 18.1)

In the reduction half-reaction, there are 6 electrons on the left-hand side, and there are 12 electrons on the right-hand side of the oxidation half-reaction □ Thus, we multiply the reduction half-reaction by 2 to give:  $+ 2 \text{Fe}^{3+} + 12\text{e}^- + 28\text{H}^+ + 2\text{CrO}_4^{2-} \rightarrow 4\text{Cr}^{3+} + 14\text{H}_2\text{O}$

## Chapter 18 Electrochemistry

Recall that oxidation is the loss of one or more electrons, and reduction is the gain of one or more electrons in a chemical reaction. Reduction and oxidation always occur together, one substance giving up one or more electrons to another, thus we call them redox reactions. You should already know how to balance redox reactions.

### Electrochemistry

In any electrochemical process, electrons flow from one chemical substance to another, driven by an oxidation-reduction (redox) reaction. As we described in Section 12.7, a redox reaction occurs when electrons are transferred from a substance that is oxidized to one that is being reduced. The reductant (a substance that is capable of donating electrons and in the process is oxidized) is the substance that loses electrons and is oxidized in the process; the oxidant (A substance that is ...

electrode is where the reduction half of the reaction takes place. The reaction that takes place in each half-cell is called a half-cell reaction. The electrode where oxidation takes place is called the anode. The electrode where reduction takes place is called the cathode. Reading Check Identify which of the beakers in Figure 20.2 contains the anode.

### Chapter 20: Electrochemistry

An electrochemical cell undergoes two half-cell reactions (one oxidation reaction and one reduction reaction). Each half-cell reaction occurs either in a cathode or an anode; therefore, an electrochemical cell always has a cathode and an anode. Recall that there are two types of electrochemical cells: a galvanic cell and an electrolytic cell.

### Electrochemical reaction - Calculations | Britannica

Introduction to Electrochemistry Oxidation-reduction reactions involve energy changes. Because these reactions involve electron transfer, the net release or net absorption of energy can occur in the form of electrical energy rather than as heat. This property allows for a great many practical applications of redox reactions.

### CHAPTER 20 Electrochemistry

### Chapter 20: Electrochemistry Flashcards - Questions and ...

Reduction is the gain of electrons by a chemical moiety. Since a moiety can give up electrons only if they have some place to go, oxidation and reduction are companion processes. Whenever one moiety is oxidized, another is reduced.

### 17.1: Oxidation-reduction Reactions - Chemistry LibreTexts

A reduction reaction is one in which a reactant in a chemical reaction gains one or more electrons. Reduction reactions always occur in conjunction with oxidation reactions, in which a reactant loses one or more electrons. Reduction-oxidation reactions are often called redox equations. A reduction reaction is only one half of a redox reaction.
