In 2007, genetic analyses of Arthrobacter sp. K172 showed that no new genes or proteins had been added that resulted in the ability of the bacteria to break down nylon.18 Instead it was discovered that mutations in a pre-existing gene resulted in a protein that is capable of breaking down nylon. The protein, known as EII, normally breaks down a substance very similar to nylon.

Sometimes gene mutations are beneficial, but most of them are detrimental. For example, if a point mutation occurs at a crucial position in a DNA sequence, the affected protein will lack biological activity, perhaps resulting in the death of a cell. In such cases the altered DNA sequence is lost and will not be copied into daughter cells.
