The String type is so much used and integrated in Java, that some call it "the special ninth type". A String in Java is actually a non-primitive data type, because it refers to an object. The String object has methods that are used to perform certain operations on strings.

Example. interface Animal { public void

```

animalSound(); public void sleep(); }
class Pig implements Animal { public
void      animalSound()      {
System.out.println("The pig says: wee
wee"); } public void sleep() {
System.out.println("Zzz"); } } class
MyMainClass { public static void
main(String[] args) { Pig myPig = new
Pig();      myPig.animalSound();
myPig.sleep(); } }

Example explained. Statement 1 sets a variable before the loop starts (int i = 0). Statement 2 defines the condition for the loop to run (i must be less than 5). If the condition is true, the loop will start over again, if it is false, the loop will end. Statement 3 increases a value (i++) each time the code block in the loop has

been executed.

If we are using Java 1.7.0_95 or later, we can add the `jdk.tls.client.protocols` property as a java command-line argument to support TLSv1.2: `java -Djdk.tls.client.protocols=TLSv1.2 <Main class or the Jar file to run>` But Java 1.7.0_95 is available only to the customers who purchased support from Oracle. So, we'll review other options below to ...

Get and Set. You learned from the previous chapter that private variables can only be accessed within the same class (an outside class has no access to it). However, it is possible to access them if we provide public get and set methods.. The get method returns the variable value, and the set method sets the value.. Syntax for both is that they start with either get or set, followed by the ...

Java - What is OOP? OOP stands for Object-Oriented Programming.. Procedural programming is about writing procedures or methods that perform operations on the data, while object-oriented programming is about creating objects that contain both data and methods.

Java OOP (Object-Oriented Programming)

For example, $x = 7 + 3 * 2$; here x is assigned 13, not 20 because operator $*$ has higher precedence than $+$, so it first gets multiplied with $3 * 2$ and then adds into 7. Here, operators with the highest precedence appear at the top of the

table, those with the lowest appear at the bottom.

In this tutorial, we will learn how to use for loop in Java with the help of

examples and we will also learn about the working of Loop in computer programming. In computer programming, loops are used to repeat a block of code. For example, if you want to show a message 100 times, then rather than typing the same code 100 times, you can use a ...

In this case, the Java compiler automatically specifies the size by counting the number of elements in the array (i.e. 5). In the Java array, each memory location is associated with a number. The number is known as an array index. We can also initialize arrays in Java, using the index number. For example,
