if $(S' - p' i_2) < x' i \tau' = \tanh(\Delta S D_z \cdot z' - p' i_2 - x' 1)$ To obtain the pile deformation caused by the soil displacement, p_{i2} is found by transforming back to dimensions: $p_{i2} = p' i_2 \cdot D_z$. The pile settlement p_i becomes $p_i = S_0 + p_{i2} - p_{i1}$ when the overall pile settlement S_0 is

reintroduced.

The soil-pile interaction problem is considered as an extension of the soil-structure interaction problem and analyzed subdividing it into sub-systems (sub-structuring approach): (1) the pile (as part of the structure) and (2) the displaced soil are both described and formulated using the finite element method, and (3) the site is described and formulated in terms of a compliance matrix (soil flexibility matrix) using the flexible volume method.

In order to discern kinematic soil-pile interaction in the pile group, amplitudes of pile-heads displacements in the free-head pile group (Test No. 5) are normalized with respect to base displacement and plotted as a function of base excitation frequencies in Fig. 6(c). Soil-Structure Interaction -Effects, Analysis and ...

Ground-structure interaction consists of the interaction between soil and a structure built upon it. It is primarily an exchange of mutual stress, whereby the movement of the ground-structure system is influenced by both the type of ground and the type of structure. This is especially applicable to areas of seismic activity. Various combinations of soil and structure can either amplify or diminish movement and subsequent damage. A building on stiff ground rather than deformable ground will ...

Soil-structure interaction - Wikipedia

The results showed that grouting can improve the bearing capacity of bored

piles and precast concrete piles by increasing the degree of pile-soil interaction and the density of soil around the pile [15, 16]. Liu et al. introduced and studied the prestressing effect in the grouting process with a typical case. The mechanism of preloading affecting bearing capacity and lateral friction was explained in detail.

A global pile response analysis accounting for the pile-soil interaction should be carried out for the mooring line reactions due to the fatigue sea states acting on the system. The local stresses that accumulate fatigue damage in the pile should be obtained by calculating a stress concentration

factor (SCF), relative to the nominal

stresses generated by the global
analysis, at the fatigue critical locations.
