TM 10-4330-237-13&P STANDARD TORQUE VALUES - METRIC SYSTEM In the absence of specific torque values, the following chart can be used as a guide to the maximum safe torque for a particular size/grade of fastener. There is no torque difference for fine or coarse threads. Torque values are based on clean, dry threads. Reduce value by 10% if threads are oiled before assembly.

STANDARD TORQUE VALUES - METRIC SYSTEM

Most bolt torque charts, including this one, are based on the material strength of the bolt - the component containing the external thread. Reference 2 below recommends a fastener preload in the range of 60% - 90% of the bolt material proof load.

Application and removal Torque Guidelines The reference guide below contains industry standard application torque specifications. It is important to not over-torque or under-torque the cap in order to achieve a properly sealed container. Many people believe the tighter the cap, the better the seal; this is not the case.

Application and removal Torque Guidelines

Values calculated using industry accepted formula T = KDP where T = Torque, K = torque coefficient (dimensionless), D = nominal diameter (inches), P = bolt clamp load, lb. K values: waxed (e.g. pressure wax as supplied on high strength nuts) = .10, hot dip galvanized = .25, and plain non-plated bolts (as received) = .20.

Torque values limit minimum and maximum gasket seating stresses based upon pressure class and certain operating conditions.(i.e: maximum pressure ratings for given pressure class,not hydrotest pressure), Extreme operating conditions such as high temperature may reduce bolt yield strength. Caution should be used in these applications.

Tightening Torque Guide - Alma Bolt Company

Torque is measured as a unit of force acting on a rotating lever of some set length. In the USA, the common unit used to measure torque is the inch-pound (abbreviated in-lb.). This is a force of one pound acting at the end of a lever (wrench) only one inch long.

It is vital that following a wheel fitting (Phase 1 – see below), the wheel nuts must be re-torqued in accordance with the manufacturers guidelines after the vehicle has stood for a period of approximately 30 minutes (Phase 2), whether the vehicle has moved or not, and preferably after 40-80 kilometres (Phase 3) using a calibrated torque wrench set to the manufacturer’s specified torque value.
