Hence, the study of metamorphic rocks provides an understanding of the pressure and temperatures deep within the earth's crust. Gneiss, marble, slate, schist, and quartzite are some of the different types of metamorphic rocks.

Slate and chalk are both sedimentary rocks. The sedimentary layers slowly sink into the crust. As the rock sink deeper, the pressure and temperature increase, and the rocks undergo

metamorphoses. They are then called metamorphic rocks. Limestone, for example, is transformed into a colorful metamorphic rock, marble. The natural movements of Earth's crust can thrust sedimentary and metamorphic layers toward the surface or push them deeper into the mantle.
