other issues.

Chiller Fault Finding - The Engineering Mindset

The first thing the
chiller needs to know is
that there is water
flowing in the
evaporator and the
condenser water loops.

The chiller will not start, or should not start, if there is inadequate flow. This is to protect the chiller from freezing and bursting the internal heat exchanger tubes inside these vessels. If the water inside the tubes was too slow, it could freeze and split the pipes.

Chiller Control Basics - The Engineering Mindset

Make sure that the chiller is running. A blown circuit breaker or fuse, loose wiring, or simply a power switch that's been put in the "off" position might be preventing the chiller from running.

Determine whether the chiller is cooling. Check the temperature of the coolant at the chiller's outlet to the process.
