In signals and systems the concept of bounded-input bounded-output (BIBO) stability is introduced Satisfying this definition requires that every bounded-input ($|x(t)| < 1$) produces a bounded output ($|y(t)| < 1$) For LTI systems a fundamental theorem states that a system is BIBO stable if and only if $\sum_{n=-\infty}^{\infty} |h(n)| < \infty$.

In system analysis, among other fields of study, a linear time-invariant system is a system that produces an output signal from any input signal subject to the constraints of linearity and time-invariance; these terms are briefly defined below. These properties apply to many important physical systems, in which case the response y of the system to an arbitrary input x can be found directly using convolution: $y = x * h$ where h is called the system's impulse response and $*$ represents convolution.

In terms of system theory, the problem is to find the system that changes the transmitted signal into the received signal. At first glance, it may seem an overwhelming task to understand all of the possible systems in the world. Fortunately, most useful systems fall into a category called linear systems. This fact is extremely important. Without the linear system concept, we would be forced to examine the individual characteristics of many unrelated systems.
