Isometries on Banach spaces: function spaces. Fundamental to the study of any mathematical structure is an understanding of its symmetries. In the class of Banach spaces, this leads naturally to a study of isometries-the linear transformations that preserve distances. In his foundational treatise, Banach showed that every linear isometry on the space of continuous functions on a compact metric space must transform a continuous function x into a continuous function y satisfying $y(t) = h(t)x(p(t))$, where p is a homeomorphism and $h \dots$

In mathematics, an isometry (or congruence, or congruent transformation) is a distance-preserving transformation between metric spaces, usually assumed to be bijective. A composition of two opposite isometries is a direct isometry. A reflection in a line is an opposite isometry, like R_1 or R_2 on the image. Translation T is a direct isometry: a rigid motion.

Given a separable Banach space E , we construct an extremely non-complex Banach space (i.e. a space satisfying that $\|Id + T\| = 1 + \|T\|$ for every bounded linear operator T on it) whose dual contains E^* as an L -summand.
