The field of calculus for this is the most general, namely matrix calculus. To recap, $f(x)$ is a scalar function of a scalar variable (use simple derivative rules), $f(x)$ is a scalar function of vector variable x (use vector

calculus rules) and $f(x)$ is a vector of many scalar valued functions, with each function depending on a vector of inputs x (use matrix calculus rules).

Matrix calculus is concerned with rules for operating on functions of matrices. For example, suppose that an $m \times n$ matrix X is mapped into a $p \times q$ matrix Y . We are interested in obtaining expressions for derivatives

Matrix Calculus - Notes on the Derivative of a Trace. Johannes Traa. This write-up elucidates the rules of matrix calculus for expressions involving the trace of a function of a matrix X : $f^T \text{tr. } g(X) /$. (1) We would like to take the derivative of f with respect to X : $\partial f / \partial X$. (2) One strategy is to write the trace expression as a scalar using index notation, take the derivative, and re-write in matrix form.

Note, however, that when we are dealing with vectors, the chain of matrices builds “toward the left.” For example, if w is a function of z , which is a function of y , which is a function of x , $\frac{\partial w}{\partial x} \frac{\partial x}{\partial z} \frac{\partial z}{\partial y} \frac{\partial y}{\partial w} \frac{\partial w}{\partial z}$.(D.25)

Welcome to matrix calculus! Note that

there are multiple ways to represent the Jacobian. We are using the so-called numerator layout but many papers and software will use the denominator layout. This is just transpose of the numerator layout Jacobian (flip it around its diagonal):

The matrix calculus you need for deep learning

Matrix calculus refers to a number of different notations that use matrices and vectors to collect the derivative of each component of the dependent variable with respect to each component of the independent variable. In general, the independent variable can be a scalar, a vector, or a matrix while the dependent

variable can be any of these as well.

$0)$ is one polar representation of z . Write the non-zero complex number z as $z = |z|(\cos(\theta) + i\sin(\theta))$, and note that the angle then satisfies $\tan(\theta) = \frac{\text{Im}(z)}{\text{Re}(z)}$ provided $\text{Re}(z) \neq 0$. However, because θ is determined only up to multiples of 2π but $\tan(x)$ is determined up to multiples of π , we see that $\theta = \tan^{-1}$.
