Variable Selection And Neural Networks

In a input variable selection problem one has two possibilities concerning the inclusion or not of this variable. To test all possibilities one would have to perform 2^N experiments, where N is the number of variables. In our case we would have to run 241 Neural Networks to choose the input variables combination that provides the best performance.

If we use as inputs the variables selected by WD (from results shown in Fig. 11, we have selected the 4 variables x_{i-1} , x_i , x_{i+1} and x_{i+2}), and retrain a network 4-7-1 with only these inputs, we obtain a final MSE lower than both the initial 10-7-1 network and the network 3-7-1 retrained on the variables selected by SAS or OCD (for an analysis of the significance of these results, see Appendix 3 where error bars are provided).

The Importance of Variable Selection for Neural Networks ...

This article connects input variable selection with multiple testing in the

neural network regression models. In the proposed procedure, the number and the type of input neurons are selected by means of a testing scheme, based on appropriate measures of relevance of a given input variable to the model.

Input Variable Selection in Neural Network Models ...

A very straightforward variable selection procedure is: Inspect the Hinton diagram and remove the variable whose weights are closest to zero. Re-estimate the neural network with the variable removed. To speed up the convergence, it could be beneficial to start from the previous weights. Continue with step 1 until a stopping criterion is met.

Abstract: In this paper, a novel variable selection method for neural network that can be applied to describe nonlinear industrial processes is developed. The proposed method is an iterative two-step approach. First, a multilayer perceptron is constructed. Second, the least absolute shrinkage and selection operator is introduced to select the input variables that are truly essential to the ...

The weights that connect variables in a neural network are partially analogous to parameter coefficients in a standard regression model and can be used to describe relationships between variables. That is, the weights dictate the relative influence of information that is processed in the network such that

input variables that are not relevant in their correlation with a response variable are suppressed by the weights.

2.4. Variables Selection of Neural Networks. To compare logistic regression (LR) and neural networks (NNs) models, many papers use the same variables for both input models (the variables selected by the multivariate analysis) . Neural networks are an example of a supervised machine learning algorithm that is perhaps best understood in the context of function approximation. This can be demonstrated with examples of neural networks approximating simple one-dimensional functions that aid in developing the intuition for what is being
