An effective synthetic procedure where the DOTA-linked peptide amide is synthesized on a single solid-phase support offers several advantages: the ease of coupling and time to synthesize one DOTA-peptide amide is dramatically reduced because DOTA is introduced to the peptide backbone [3, 5, 9, 10] while the peptide still attached to resin support, resulting in the formation of relatively pure DOTA-peptide product. Also, a large molar excess of DOTA will not be required as in solution-phase ...

Abstract We report a general and operationally simple method for the solid phase synthesis of α -ketoamide peptides using standard Fmoc solid phase peptide synthesis. The method delivers deprotected peptide α -ketoamides directly upon resin cleavage without any additional steps, and tolerates all side chain functional groups.

Typically, the peptides are cleaved from the support together with the side-chain protecting groups, but there are several experimental procedures, which require solid-phase-bound peptides. The SPOT technique uses membranes as the solid support and enables the parallel synthesis and testing of hundreds to thousands of peptides at different locations on one membrane (Frank 1992).

The most commonly N-terminal protecting group used in Solid Phase Peptide Synthesis (SPPS) is the Fmoc group (9-fluorenylmethoxycarbony-) (Scheme 1, Table 1) [1]– [3]. Besides the coupling procedure, the Fmoc deprotection step is another most crucial stage in peptide synthesis. Above all, the property which makes it a valuable tool is its stability in acidic conditions.
