The Chick Embryo Chorioallantoic Membrane

During avian development the mesodermal layers of the allantois and chorion fuse to form the chorioallantoic membrane (CAM). This structure rapidly expands generating a rich vascular network that provides an interface for gas and waste exchange.

Abstract. During avian development the mesodermal layers of the allantois and chorion fuse to form the chorioallantoic membrane (CAM). This structure rapidly expands generating a rich vascular network that provides an interface for gas and waste exchange. The CAM allows to study tissue grafts, tumor growth and metastasis, wound healing, drugs delivery and toxicologic analysis, and angiogenic and anti-angiogenic molecules.

The chick embryo chorioallantoic membrane (CAM). A ...

Among the in vivo models, the chick embryo chorioallantoic membrane (CAM) has been used to implant several tumor types as well as malignant cell lines to study their growth rate, angiogenic potential and metastatic capability.

The chick embryo chorioallantoic membrane as a model for ...

The chick embryo chorioallantoic membrane (CAM) has long been a favored system for the study of tumor angiogenesis because at the stage of development when generally tumor grafts are placed (6–10 days of incubation), the chick’s immunocompetent system is not fully developed and the conditions for rejection have not yet been established.

The chick embryo chorioallantoic membrane as an in vivo ...

The chick chorioallantoic membrane is a very simple extraembryonic membrane which serves multiple functions during embryo development; it is the site of exchange of respiratory gases, calcium transport from the eggshell, acid-base homeostasis in the embryo, and ion and O reabsorption from the allantoic fluid. All these functions are accomplished by its epithelia, the chorionic and the allantoic epithelium, by differentiation of a wide range of structural and molecular peculiarities which ...

The Chick Embryo Chorioallantoic Membrane (CAM) Assay

The chick embryo chorioallantoic membrane (CAM) refers to the outermost extra-embryonic membrane that is highly vascularized for gaseous exchange and calcium transportation between the embryo and its environment. The CAM provides a technically simple way of studying complex biological systems with well-developed vascular tissues. It also has high

Chick embryo chorioallantoic membrane (CAM): an ...

The chick embryo chorioallantoic membrane (CAM) is an extraembryonic membrane, which serves as a gas exchange surface and its function is supported by a dense capillary network. Because its extensive vascularization and easy accessibility, CAM has been used to study morphofunctional aspects of the angiogenesis process in vivo and to study the efficacy and mechanism of action of pro- and anti ...

The chick embryo chorioallantoic membrane as a model to ...

At 10 days during fertilization, chick embryo develops and is surrounded by a nutrient rich membrane called chorioallantoic membrane. A window is made on the egg shell and human cancer cells are transplanted onto the CAM membrane. Surprisingly, tumor is formed in 3 days after the transplantation (Fig. 4). The tumor formed retains characteristics of tumor.

Chorioallantoic Membrane Assay - an overview ...

The Chorioallantoic Membrane, also known as the chorioallantois, is a highly vascularized membrane found in the eggs of certain amniotes like birds and reptiles. It is formed by the fusion of the mesodermal layers of two extra-embryonic membranes – the chorion and the allantois. It is the avian homologue of the mammalian placenta. It is the outermost extra-embryonic membrane which lines the non-vascular egg shell membrane.

Chorioallantoic membrane - Wikipedia

The chick chorioallantoic membrane is a very simple extraembryonic membrane which serves multiple functions during embryo development; it is the site of exchange of respiratory gases, calcium transport from the eggshell, acid-base homeostasis in the embryo, and ion and H2O reabsorption from the allantoic fluid.

The chick embryo and its chorioallantoic membrane (CAM ...

The use of chick embryo models for angiogenic studies is facilitated by the existence in avian species of a specialized respiratory tissue, named the chorioallantoic membrane (CAM) that allows for gas exchange between the embryo and the atmosphere surrounding the egg and in effect performs the function of a lung during embryonic life (Romanoff, 1960).

CHAPTER TWO: Chick Embryo Chorioallantoic Membrane Models ...

The chick embryo chorioallantoic membrane (CAM) is a highly vascularized extraembryonic membrane. Because of its ease of accessibility, extensive vascularization and immunodeficient environment, the CAM has been broadly used in the oncology, biology, pharmacy, and tissue regeneration research.

Application of the Chick Embryo Chorioallantoic Membrane ...

The chick embryo chorioallantoic membrane (CAM) assay ...

The chicken embryo chorioallantoic membrane assay has been a model for studying neovascularization since the early 1970’s when it was adapted by Folkmann et al.

Chick Chorioallantoic Membrane (CAM) Assay | Thermo Fisher ...

The present review outlines the potential use of the chick embryo, and specifically its chorioallantoic membrane (CAM), as an alternative to mammalian models for the evaluation of DDS. The CAM of the developing chick embryo is an extraembryonic membrane mediating gas and nutriment exchanges until hatching.

The chick embryo and its chorioallantoic membrane (CAM ...

Other models, such as the chick embryo chorioallantoic membrane (CAM) assay, are therefore an attractive alternative. CAM assays have been widely used to study angiogenesis and tumor invasion of colorectal, prostate and brain cancers.
