Partial Differential Equations Penn Math

In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 - 3x + 2 = 0$. However, it is usually impossible to write down explicit formulas for solutions of partial differential equations.

In contrast, a partial differential equation (PDE) has at least one partial derivative. Here are a few examples of PDEs: DEs are further classified according to their order. This classification is similar to the classification of polynomial equations by degree. First-order ODEs contain only first derivatives. For example:

The resulting differential equation is $dS/dt = rS + k$, (7.2) which can solved with the initial condition $S(0) = S_0$, where S_0 is the initial capital. The differential equation is linear and the standard form is $dS/dt - rS = k$, so that the integrating factor is given by. $m(t) = e^{rt}$. The solution is therefore $S(t) = e^{rt}$.
