In primary treatment, water is piped into large tanks and allowed to settle to remove particulate

solids. Secondary treatment uses microorganisms to remove more contaminating solids. Next, the wastewater goes through tertiary treatment, and finally, the it may go through a second settling process to remove any remaining particulate matter .

What is Tertiary Treatment? (with pictures)

The principal difference in primary and secondary treatment is the process that breaks down the sewage in wastewater. In the primary method, the waste processes through a physical procedure with equipment and filtration. While secondary treatment may use similar items, this method uses

biological treatment through microbes.

Primary, Secondary, and Tertiary Treatment

Tertiary treatments are advanced treatments following secondary treatment. They are often considered for color removal because primary and secondary treatments are not particularly effective in this area. Secondary treatments may remove on the order of 50% of the color.

Tertiary Treatment - an overview | ScienceDirect Topics

Secondary treatment removes the soluble organic matter that escapes primary treatment. It also removes more of the suspended solids. Removal is usually

accomplished by biological processes in which microbes consume the organic impurities as food, converting them into carbon dioxide, water, and energy for their own growth and reproduction.

Wastewater treatment - Primary treatment | Britannica

Tertiary treatment refers to secondary treatment followed by a filtration step, such as media filtration, so that the turbidity and TOC concentrations are generally lower, and if coagulation with metal salts is used, then the phosphate concentration will also be reduced (Henriksen, 1963).
