A Seamless Vertical Handoff Algorithm in 4G Networks ...

The 4G mobile system is a collection of radio networks providing access to IP based services. It ensures seamless roaming and users are always connected to the best network providing QoS (Quality of Service) to the end user. The mechanism of switching to a different

network is termed as vertical handoff. In this paper we propose a vertical handoff management architecture which ensures efficient utilization of a mobile terminal resource i.e. CPU.

Adaptive Vertical Handoff Management Architecture ...

Vertical handoff is also defined as the exchange of connections between different access points in the same network that can either be in Wi-Fi, WiMAX or LTE. Access point used in WLAN system is worked similar to the base station and covers shorter area.

Vertical handoff is preformed on the basis of Quality of Service (QoS) metrics of the two heterogeneous networks. A Seamless handoff scheme is based on the tightly coupled architecture so that undesirable signaling cost induced by the mobile Internet protocol can be avoided with aim to provide always best QoS for the users (mobile and fixed).

The convergence of mobile homogeneous networks to heterogeneous networks had put forth the challenge of seamless handovers between different radio access networks with

maintained QoS. Efficient vertical handover decision strategy is vital for heterogeneous WiMax/WLAN networks that in return do combine advantages from both access technology in terms of data rates and coverage, offering high QoS to mobile users.
