It starts with the sarcomere which is the functional unit of muscle. The motor neuron receives a nerve signal and then is sent to the sarcoplasmic reticulum to release calcium for contraction. Calcium floods into the muscle cell binding with troponin allowing actin and myosin to bind causing stimulus for contraction.

Muscle contraction events describing the sliding-filament concept

are listed as follows. ATP binds to a myosin head and forms ADP + P i. When ATP binds to a myosin head, it is converted to ADP and P i, which remain attached to the myosin head. Ca 2+ exposes the binding sites on the actin filaments. Ca 2+ binds to the troponin molecule, causing tropomyosin to expose positions on the actin filament for the attachment of myosin heads.
