Sintering or frittage is the process of compacting and forming a solid mass of material by heat or pressure without melting it to the point of liquefaction. Sintering happens naturally in mineral deposits or as a manufacturing process used with metals, ceramics, plastics, and other materials. The atoms in the materials diffuse across the boundaries of the particles, fusing the particles together and creating one solid piece. Because the sintering temperature does not have to reach the melting po

Sintering - Wikipedia

The last-mentioned property determines the ceramic processing. The shaping process normally ends up with a so-called green body. Generally, ceramic materials must be finally densified by a sintering process, which provides their desired mechanical strength. This makes ceramics different from metals or polymers.

Along the ceramic manufacturing process, the main mass inputs are in the powder processing step where the solid raw materials are homogenized, eventually with the addition of recycled raw materials. After shaping, excess water is removed by drying, which is accomplished in dryers or, in some cases, in an ambient room.

Ceramic Processing - an overview | ScienceDirect Topics

If a mixture of different materials is used together in a ceramic, the sintering temperature is sometimes above the melting point of one minor component – a liquid phase sintering. This results in shorter sintering times compared to solid state sintering. Strength of ceramics. A material's strength is dependent on its microstructure.
