Under ALTER3, there exists no Granger

causality in mean nor in variance, but there exists Granger causality in risk, due to the causality in skewness and in kurtosis from Y_{2t} to Y_{1t} with respect to $I_t - 1$. To our knowledge, the financial econometric literature has been focusing on spillover in mean and in variance; no study on spillover in skewness and kurtosis was not previously available in the literature.

Abstract. Controlling and monitoring extreme downside market risk are important for financial risk management and portfolio/investment diversification. In this paper, we introduce a new concept of Granger causality in risk and propose a class of kernel-based tests to

detect extreme downside risk spillover between financial markets, where risk is measured by the left tail of the distribution or equivalently by the Value at Risk (VaR).

The $\sum_{j=1}^q \alpha_{2j}$ and $\sum_{j=1}^q \beta_{2j}$ verifies the Granger causality for conventional banks, the $\sum_{j=1}^q \alpha_{3j}$ and $\sum_{j=1}^q \beta_{3j}$ capture the sensitivity difference produced by Islamic banks, hence $\sum_{j=1}^q \alpha_{2j} + \sum_{j=1}^q \alpha_{3j}$ and $\sum_{j=1}^q \beta_{2j} + \sum_{j=1}^q \beta_{3j}$ measure the Granger causality for Islamic banks. We again run all the bank-fixed effects regressions with and without other bank characteristics.

Granger's causality Tests the null hypothesis that the coefficients of past values in the regression equation is zero. In simpler terms, the past values of time series (x) do not cause the other series (y). So, if the p-value obtained from the test is lesser than the significance level of 0.05, then, you can safely reject the null hypothesis.

We define a bank-bond Granger-causality tail risk network as a bipartite network where banks and bonds form the two sets of nodes, and the existence of a bank-bond edge is established with the test of Granger-causality in tail of Hong et al. (2009). Rejection of the null hypothesis of the test provides statistical support for a causal relationship in the tail between a bank and a bond, and an edge is created.

Granger causality is a simple formulation to test if preceding values of a variable X help explain some of the variance observed in variable Y. To test for this we first need to regress Y on past value of itself to capture any autoregressive features. Typical set up of the test sets up below equation:
