According to the Law of Reflection, the angle of incidence will equal the angle of reflection when light is shone off a flat reflecting surface. When light is shone off a spherical mirror, it will converge at a focal point. Light will converge at a real focal point in front the concave mirror, and light will converge at a virtual focal point somewhere behind the convex mirror.

Description. This is a simple simulation showing the reflection and refraction of a

ray of light as it attempts to move from one medium to another. Use the sliders to adjust the index of refraction of each of the two materials, as well as the angle of incidence (the angle between the incident ray of light and the normal to the surface). Use the check boxes to show or hide various information.

Reflection. This area of Physics is frequently considered to be 'easy' and 'straightforward', this is because we are familiar with what we see in the mirror - the image seen (often) as we expect; and we use mirrors daily. "Light travels in straight lines" - this is a statement you will be familiar with since the KS3.

Theory When light (wave) travelling in one medium encounters a boundary of another medium, part of the light bounce back to the same medium, called the Reflection and some part of light may pass into the second medium, called the Refraction. In this lab, you will study reflection of light from different mirrors.

Reflection, abrupt change in the direction of propagation of a wave that

strikes the boundary between different mediums. At least part of the oncoming wave disturbance remains in the same medium. Regular reflection, which follows a simple law, occurs at plane boundaries. The angle between the direction of motion of the oncoming wave and a perpendicular to the reflecting surface (angle of incidence) is equal to the angle between the direction of motion of the reflected wave and a ...

Reflection is the change in direction of a wavefront at an interface between two different media so that the wavefront returns into the medium from which it originated. Common examples include the reflection of light, sound and water

waves. The law of reflection says that for specular reflection the angle at which the wave is incident on the surface equals the angle at which it is reflected. Mirrors exhibit specular reflection. In acoustics, reflection causes echoes and is used in sonar. In geol
