Intelligent Vehicular Network and Communications: Fundamentals, Architectures and Solutions begins with discussions on how the transportation system has transformed into today's Intelligent Transportation System (ITS). It explores the design goals, challenges, and frameworks for modeling an ITS network, discussing vehicular network model technologies, mobility management

architectures, and routing mechanisms and protocols.

Intelligent Vehicular Networks and Communications ...

In the last two decades, vehicular ad hoc networks (VANETs) were the topic of many research studies. The emergence of multiple wireless access technologies and the wide number of applications provided by VANET explain the significant interest in this field. Enabling communication between vehicles and infrastructure equipment (e.g. roadside units, cameras) provides drivers and traffic authorities with information related to traffic conditions and incidents.

VANETs were first mentioned and introduced in 2001 under "car-to-car ad-hoc mobile communication and networking"

applications, where networks can be formed and information can be relayed among cars. It was shown that vehicle-to-vehicle and vehicle-to-roadside communications architectures will co-exist in VANETs to provide road safety , navigation, and other roadside services.
