MRI Guided Focused Ultrasound Surgery | Stanford Health Care

MRI Guided Focused Ultrasound (MRgFUS) Focused ultrasound is an early-stage, non-invasive and incision-free therapeutic technology with the potential to transform the treatment of many medical disorders, by using ultrasonic energy to target tissue deep in the body without incisions or radiation.

MRI-guided focused ultrasound (MRgFUS) surgery is a noninvasive thermal ablation method that uses magnetic resonance imaging (MRI) for target definition, treatment planning, and closed-loop control of energy deposition.

MRI-Guided Focused Ultrasound Surgery | Annual Review of ...

In the first focused ultrasound trials (22, 40), the ultrasound exposures ("sonications") were performed through a craniotomy, making a noninvasive procedure invasive and substantially less desirable. For this reason, only a few other clinical trials in the brain have been attempted (20, 21, 41 - 43).

Transcranial MRI-guided focused ultrasound surgery of ...

MR guided Focused Ultrasound Surgery is a non-invasive, outpatient procedure which uses high doses of focused ultrasound waves (HIFU) to destroy uterine fibroids, without affecting any of the other tissues around the fibroid. The procedure is conducted in a magnetic resonance imaging (MRI) scanner which helps the physician "see" inside the body to pinpoint, guide, and continuously monitor the treatment.

MRI Guided Ultrasound - Fibroid Treatment Collaborative

Focused ultrasound surgery (FUS), a form of thermal tissue ablation, is a noninvasive technique first used in 1942 (1). However, its acceptance was limited because of a lack of precise target definition and difficulty in controlling the focal spot position and beam dosimetry.

MRI-guided Focused Ultrasound

Surgery of Uterine ...

Magnetic resonance-guided focused ultrasound (MRgFUS) technology uses MRI imaging to guide high powered, focused ultrasound to a very small point. At that point, molecules are vibrated extremely quickly, which creates intense local heat. That heat can "cook" tissue and destroy it.

MR-guided focused ultrasound for essential tremor

MR-guided focused ultrasound is approved for the treatment of essential tremor that cannot be controlled with medication. Approval is for treatment of one side of the brain only. Patients must be at least 22 years of age. Tremor-dominant Parkinson's disease. MR-guided focused ultrasound is approved to treat patients with Parkinson's disease whose main symptom is tremor. Patients must be at least 30 years of age.

MR-Guided Focused Ultrasound for Tremor

Magnetic resonance-guided focused ultrasound surgery will revolutionize medicine. One of its most potent applications is to destroy tumours noninvasively. It can be thought of as "scalpel-free surgery," because no incision is required to remove the tumour.

It is also known as MRgFUS (MRI-guided focused ultrasound) and FUS (focused ultrasound surgery). HIFU is an innovative, non-invasive treatment for a wide range of tumors and diseases. HIFU uses an ultrasound transducer, similar to the ones used for diagnostic imaging, but with much higher energy.

High-Intensity Focused Ultrasound (HIFU) | UCSF Radiology

Magnetic resonance guided focused ultrasound surgery (MRgFUS) was recently presented as a method for ablation with focused ultrasound under magnetic resonance imaging guidance. It has the advantage of improved targeting and real time temperature monitoring but only a few studies have been conducted with human patients.
