Introduction To Non Euclidean Geometry

In non-Euclidean geometry, the concept corresponding to a line is a curve called

a geodesic. In non-Euclidean geometry a shortest path between two points is along such a geodesic, or "non-Euclidean line". All theorems in Euclidean geometry that use the fifth postulate, will be altered when you rephrase the parallel postulate.

Non-Euclidean Geometry: Introduction

Non-Euclidean geometry is the study of geometry on surfaces which are not flat. Because the surface is curved, there are no straight lines in the traditional sense, but these distance minimizing curves known as geodesics will play the role of straight lines in these new geometries.

Euclidean geometry is a mathematical system attributed to Alexandrian Greek

mathematician Euclid, which he described in his textbook on geometry: the Elements. Euclid's method consists in assuming a small set of intuitively appealing axioms, and deducing many other propositions from these. Although many of Euclid's results had been stated by earlier mathematicians, Euclid was the first to show ...

A Quick Introduction to Non-Euclidean Geometry

In mathematics, non-Euclidean geometry consists of two geometries based on axioms closely related to those that specify Euclidean geometry. As Euclidean geometry lies at the intersection of metric geometry and affine geometry, non-Euclidean geometry arises by either relaxing the metric requirement, or replacing the parallel postulate with an alternative. In the latter case one obtains hyperbolic geometry and elliptic geometry, the traditional non-Euclidean geometries. When the metric requirement
