For stationary Markov processes, these can be found, in general, by the solution of the system : $P \Pi = P$, $P_i = 1$ where P is the state probability vector and Π is the transition matrix : $\Pi[ij] = P(x_j | x_i)$. However, in the case of a two-state Markov source, we can find $P(x_i)$ in a simpler way by noting that the probability of a transition from state 1 to state 2 equals the probability of a transition from state 2 to state 1 (so that

the probability of each state will remain the same).
