Automatic fire suppression systems control and extinguish fires without human intervention. Examples of automatic systems include fire sprinkler system, gaseous fire suppression, and condensed aerosol fire suppression. When fires are extinguished in the early stages loss of life is minimal since 93% of all fire-related deaths occur once the fire has progressed beyond the early stages.

Manual fire alarm activation is typically achieved through the use of a pull station or call point, which then sounds the evacuation alarm for the relevant building or zone. Manual fire alarm activation requires human intervention, as distinct from automatic fire alarm activation such as that provided through the use of heat detectors and smoke detectors. It is, however, possible for call points/pull stations to be used in conjunction with automatic detection as part of an overall fire detection

Manual fire alarm activation - Wikipedia

A remote manual-pull station is provided in order to increase the level of protection to staff and equipment. Cooking appliances should be switched off and exhaust fans should be left on. The forced draft of these fans assists the movement of the liquid agent through the ventilating system, thus helping in the fire suppression process.
