C=O. 150 - 200. The
C-13 NMR spectrum for
but-3-en-2-one. This is
also known as 3-
buten-2-one (amongst
many other things!)
Here is the structure
for the compound: You
can pick out all the
peaks in this
compound using the
simplified table above.
The peak at just under
200 is due to a carbon-
oxygen double bond.

**interpreting C-13

Peak integration is
generally not useful in
13 C-NMR
spectroscopy, except
when investigating
molecules that have
been enriched with 13
C isotope (see section
5.6B). The resonance
frequencies of 13 C
nuclei are lower than
those of protons in the
same applied field - in
a 7.05 Tesla
instrument, protons
resonate at about 300
MHz, while carbons
resonate at about 75
MHz.

We have seen that ^{13}C NMR is usually decoupled and therefore there is no splitting of signals which limits the information we can get as to how many hydrogens are connected to a carbon atom. And even combining ^1H and ^{13}C

^{13}C NMR spectra may not give a definite evidence for choosing only one structure.

**DEPT NMR: Signals
and Problem Solving

Next functional group recognizable in ^1H NMR spectroscopy is the ~ 10 ppm signal of aldehydes. Usually, it shows up as a singlet, though splitting with adjacent protons is not uncommon either:

Another way of identifying aldehydes and ketones as well as checking for a ~ 200 ppm signal on the ^{13}C NMR. Esters and carboxylic acids appear less downfield - 160-180 ppm.
