Lab Report Acid Base Titration Essay - 1352 Words

In an acid-base titration, a certain amount of a titrant with a known concentration is added to completely neutralize the titrand—

the unknown concentration, reaching the equivalence point. The equivalence point is reached when the moles of titrant added to the solution is stoichiometrically equal to the titrand in the solution. The purpose of the experiment was to first be able to determine if an unknown solution was a buffered, or an unbuffered solution.

From this given volume, the concentration of either titrant or analyte can be determined when equilibrium is reached between reactant and product (Murphy, 2012, p.305). In this experiment, the reagents combined are

an acid, HCl (aq) and a base, NaOH (aq) where the acid is the analyte and the base is the titrant.

Experiment #2: Acid-Base Titration Lab

Description: Acid-Base Titration Introduction In this lab exercise we will evaluate the effectiveness of several indicators for the determination of the point of completion of a specific acid-base neutralization reaction. We will also determine the unknown concentration of the strong base NaOH by its reaction with a known amount of the weak acid, potassium acid phthalate (HKC8H4O4, abbreviated KHP).

This is a chemistry lab report on an Acid-Base Titration ...**Goal and Overview**

Antacids are bases that react stoichiometrically with acid. The number of moles of acid that can be neutralized by a single tablet of a commercial antacid will be determined by back titration. To do the experiment, an antacid tablet will be dissolved in a known excess amount of acid.

Introduction The following lab was an acid-base neutralizing titration. A titration is a technique, in which a reagent, called a titrant, of known concentration is used to determine the concentration of an analyte or unknown solution. Using a calibrated burette, the initial volume of the titrant is recorded.
